

WHY IS ORAL HEALTH SO IMPORTANT?

Oral health and school success are connected

- Tooth decay is the most common chronic childhood disease.
- Kids miss 51 million hours of school every year due to oral health problems (many of which are easily preventable).¹
- Students who are absent miss critical instruction time, especially in early grades where reading skills are a focus.
- Kids who have experienced recent oral health pain are 4 times more likely to have lower grade point averages in high school than kids who haven't.²
- Kids with dental problems have trouble smiling, speaking, sleeping and learning at school.

Help your child show up for school every day healthy and ready to learn by developing good oral health habits early!

FINDING DENTAL CARE

It's important to find a dentist who makes your whole family feel comfortable. To find a dentist in your area, check out www.deltadentalar.com.

If a family does not have dental benefits, they may still be able to receive dental treatment at little to no cost. Below are some options for finding dental care:

Arkansas State Dental Association
<http://arkansasdentistry.org/community>

Community Health Centers of Arkansas
<http://www.chc-ar.org/locations>

Arkansas Mission of Mercy
<http://www.arkansasmissionofmercy.org>

FROM DROOL TO SCHOOL

Tips for caring for your child's oral health from the drool years through school years.

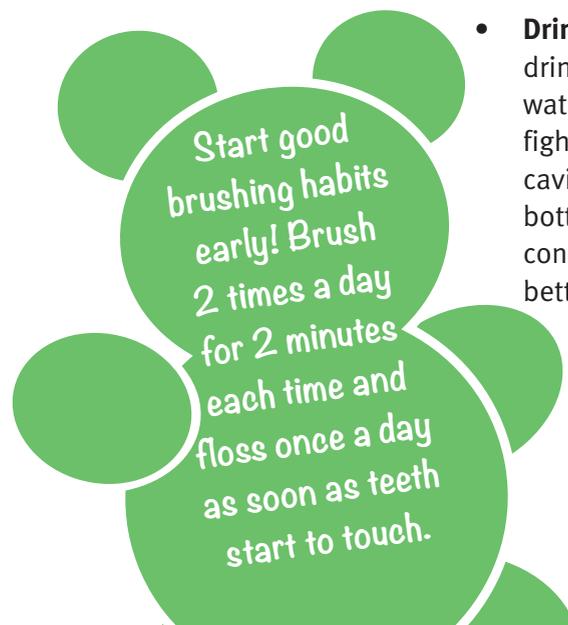

Newborns and infants

- **Keep baby's gums clean and healthy**—massage gums with a damp washcloth after each feeding to keep gums and mouth clean and healthy.
- **Stop the spread of germs and cavity-causing bacteria**—do not share cups, silverware, etc. with your baby.
- **Teething can cause sore gums**—try offering your baby something cool like a cold teething ring or wet washcloth to ease soreness.
- **Visit the dentist early**—your baby's first visit should happen by his/her first birthday.

Toddlers and preschoolers

- **Toothbrushing is important**—use a pea-sized amount of fluoridated toothpaste for children between the ages of 3–6 (rice-sized amount for children younger than 3) and a soft child-sized toothbrush. Brushing should begin when the first tooth erupts. Replace toothbrushes every 4 months.
- **Visit the dentist regularly**—your child should visit the dentist at least once a year for a checkup.
- **Sucking can become a bad habit**—wean your child off the bottle at around 12 to 18 months and encourage an end to thumb sucking and pacifier use before age 4.
- **Sip all day, and the teeth will pay**—don't let your child carry around or nap with a sippy cup that contains juice, milk or other sweetened drinks as it will lead to cavities.

- **Drink tap water**—drinking fluoridated water is a great way to fight tooth decay and cavities. Because most bottled water does not contain fluoride, it's better to drink tap water.

Elementary-aged children

- **A healthy school lunch is important**—be sure to pack fruits/veggies and protein such as peanut butter, cheese, turkey or roast beef. Avoid juice, sports drinks or soda pop—water is best.
- **Protect teeth**—kids who play sports should wear mouth guards.
- **Sealants are a great way to prevent cavities**—ask your dentist about them when you visit.
- **Get ready for the tooth fairy**—kids usually lose their baby teeth between the ages of 6–12.
- **Stop the spread of germs**—don't share toothbrushes, toothpaste or bathroom drinking glasses, and wash hands before and after brushing.
- **Keep your dentist's phone number handy**—dental emergencies are very common among active kids.
