

Keeping Mom and Baby Healthy

Expecting mothers have a lot to think about during pregnancy, but one thing that shouldn't be put on the back burner is their oral health.

Changing hormone levels can make pregnant women more susceptible to oral health problems like periodontal (gum) disease. Hormonal changes can cause an increase in blood flow to the gums, resulting in inflammation, sensitivity and bleeding.¹ Pregnant women with untreated gum disease may be at a higher risk for premature deliveries and low birthweight. In addition, serious dental problems can develop further including tooth decay and tooth loss.² Because pregnancy involves the health of two, taking extra care of teeth and gums during pregnancy is essential.

Visiting the dentist while pregnant is important and safe. Tell your dentist you're expecting and the due date, as well as any changes in your oral health. Also, brush with fluoride toothpaste two times a day, floss once a day, and eat a nutritious diet.

Being proactive about your oral health before, during and after pregnancy will help keep you and your little one healthy.

Did you know?

Between 60 and 75 percent of women will develop gingivitis during pregnancy.³

Quick bites

- Poor oral health can increase the risk of spreading bacteria from the mother to her baby.
- Don't skip necessary dental treatments. More serious problems can occur later if left untreated.
- Tell your dentist about any medications or supplements you are taking, as you may need to be prescribed medication for any infections.
- Morning sickness can trigger vomiting, so rinse your mouth with a teaspoon of baking soda in a cup of water to prevent digestive acids from attacking your teeth.
- Use a soft-bristled toothbrush to reduce gum irritation.
- Schedule at least one dental visit while you're pregnant.
